"Statistical Analysis of Industrial Accidents Based on the 1962 Patient Material of the National Institute of Traumatology."

Budapest, Magyar Traumatologia, Orthopaedia es Helyreallito Sebeszet, Vol IX, No 2, 1966, pages 137-141.

Abstract: [Authors' English summary modified] A definition of the concept of occupational injuries, the statistical data of such patients, admitted to the Institute during 1962, are analyzed. The patients are classified according to sex, age, location of the injury and the therapeutical results. The length of treatment, the length of disability compensation and the exact time when the injuries occurred are also evaluated. It is concluded that most injuries were caused by inadequate discipline and the neglect of precautionary measures. The paper is merely an introduction; additional experiments and factory examinations are planned to correct the errors and to introduce better safety measures. No references.

"The Treatment of Closed, Recent Fractures of the Forearm-Diaphysis."

Budapest, Magyar Traumatologia, Orthopaedia es Helyreallito Sebeszet, Vol IX,
No 4, 1966, pages 254-261.

Abstract: [Authors' English summary modified] In recent years, various methods have been used for the treatment of recent, closed fractures of the forearm-diaphysis. A short review of these methods is given. Based on their experiences over a five year period, the results obtained by the authors with the use of conservative treatment are reviewed and compared with the results obtained with the Kirschner splint method. This latter technique was used in part with open reduction and in part with internal fixation. The treatment of the isolated fracture of the forearm, fractures of the forearm occurring simultaneously with multiple fractures, the technique of surgical intervention and the functional results are discussed in detail. On the basis of their experiences, the indications for conservative treatment and for surgical intervention as methods of choice are outlined by the authors.

TITLE: Natural and artificial aging of steel conforming to CSN 10602

SOURCE: Hutnické listy, no. 2, 1966, 120-122

TOPIC TAGS: plasticity, metal aging, metallurgic process, reinforced concrete, steel/CSN10602 steel

ABSTRACT: Mechanical properties of the CSN steel 10602 manufactured by the cold torsion process depend to a great extent upon the aging process. Reheating up to 300°C increases the strength and only slightly limits the plasticity. The steel bars for reinforced concrete should be prestressed by the electroheating technique. Savings in weight of steel could be achieved in this manner. Orig. art. has: 2 figures and 6 tables. [Based on author's Eng. abstract] [JPRS: 34,779]

Inst. de Rech. Traumatol., Brno, ČSR - ANESTH. ET ANALG. 1957, T4/5
(971-979) Graphs 4 Tables 1

The value of artificial hibernation and neuroplegia was studied in patients who had sustained severe trauma. The author thinks that Laborit's conception of shock and all the new efficient drugs are of a real utility in traumatology. Advantages and disadvantages must be found and estimated fairly. Their newness is not an obligation for indiscriminate use. Nevertheless, personal experience showed that in traumatology this technique is worthy of consideration for some patients.

"Investigation on the Histamine-Like Effect of Dextran."

Budapest, Kisérletes Orvostudomány, Vol XIV, No 6, 1962, pages 561-566.

Abstract: [Authors' summary] The authors investigated the histamine-like effect of dextran, they have not carried out any direct histamine determinations, however. Upon intravenous dextran infusion, a decrease of blood pressure, an increase of the cutaneous temperature and in some cases an improvement of the oscillometric values was observed. Subcutaneous administration of dextran leads to a local concentration of the intravenous congo red dye, the effect being similar to that of Peremin. It is suggested that dextran mobilizes histamine and the liberated histamine or histamine-like substance is responsible for the observed changes. The plasma of patients treated with dextran possesses a heparin-like "clearing effect" and the authors propose the possibility of an endogenous heparin mobilization caused by dextran.

Magyar Kémikusak Lapja, Vol. 13, 1968, No. 3, pp. 221-
227, 14 figs, 1 tab.

The possibilities of separation of the gaseous mixture obtained by the partial oxidation of methane are analysed. The problem is divided into three groups. Theoretical aspects of separating pure acetylene, short description of various processes, performance and economical evaluation of possible methods of separation. There is the essential technical information on the processes of separating acetylene from the by-products of the partial oxidation of methane.

"Transient Diabetes Insipidus with Spontaneous Cessation (Hann Syndrome)."

Budapest, Orvosi Hetilap, Vol 107, No 16, 17 Apr 66, pages 749-751.

Abstract: [Authors' Hungarian summary] In a 65 year old patient with bronchial carcinoma, diabetes insipidus developed as a result of metastasis which destroyed the posterior pituitary. The symptoms of the insipidus syndrome disappeared later, parallel with the spreading of the metastatic tumor to the anterior pituitary. The symptoms were first described by Hann and could be termed . . . Hann's syndrome. All 25 references are Western.
